

Work with our AI platform on your own hardware*

Execute antibody discovery and affinity optimization campaigns locally on your high-performance Apple workstation. A private, secure solution tailored for targeted discovery without cloud deployment overhead.

The Setup

Instead of managing complex remote compute nodes or cloud permissions, our AI setup leverages your high-performance local Apple workstation running fine-tuned, open-source architectures like **Boltz** and **ESM-2**, tailored with bespoke, domain-specific heuristics and our proprietary

The Workflow

Instead of brute force, we use smart architectural shortcuts to weed out the noise. Our multi-tiered loop begins with our proprietary, superfast local affinity optimizer to quickly refine sequence candidates. We then invoke heavy deep-learning inference models like **Boltz** only on highly refined candidate pools to

The Outcome

Our specialty enables hyper-targeted campaigns, allowing a single computational scientist to achieve the output of a traditional laboratory department. By turning structural biology into a refined, step-wise logical filter, you are executing high-level developability and affinity strategies locally on your

hardware.

The AutoAb Local Discovery Loop

* Designed specifically for Apple Silicon (MacBook Pro, Mac mini, or Mac Studio with an M4 Max chip and 64 GB or more of unified memory) to execute all simulations locally. No cloud subscription required, ensuring absolute security and intellectual property privacy.
